Table of contents

I	List of abbreviations	X
II	List of figures	XII
III	List of tables	XIV
1.	Introduction and outline	1
1.1	Introduction.....	2
1.2	Outline of this thesis	3
2.	Theoretical Background	5
2.1	Basic principles of T secretion and biological actions	6
2.1.1	Testosterone biosynthesis	6
2.1.2	Regulation of T biosynthesis.....	7
2.1.3	Transport in blood, metabolism in target cells and genomic actions of T.....	9
2.1.4	Patterns of T secretion and biological actions over the life span	9
2.2	Testosterone and men's health	11
2.2.1	Body composition, strength, obesity and the metabolic syndrome	11
2.2.2	Depression.....	12
2.2.3	Libido and virility	13
2.2.4	Bone mineral density, osteoporosis and frailty	13
2.2.5	Mortality	13
2.2.6	A note on adverse effects of T administration	14
2.3	Psychobiological aspects of T secretion	15
2.3.1	Sexual activity, exercise and cognition.....	15
2.3.2	Stress.....	15
2.3.3	Aggression and social status	19
2.3.4	Social status and stress coping	24
2.3.5	Paternal bonding.....	26
3.	Research hypotheses	29
3.1	Set I: Manipulation check on stress induction and hemoconcentration	30
3.2	Set II: Do T levels increase with social stress in men? If so, which mechanisms operate?.....	30
3.3	Set III: Is social status related to T stress increases and lower aggression?.....	31

3.4 Set IV: Is social status associated with stress coping and health outcomes?	32
3.5 Set V: Is parental bonding associated with stress-related T increases, aggression, stress responses, and health outcomes?	32
4. Methods	35
4.1 Recruitment of participants and exclusion criteria	36
4.2 Study participants	37
4.3 General setting of the study and study procedure	40
4.3.1 Pre-study information and instructions for participants	40
4.3.2 Setting of the study	40
4.3.3 Testing day: Prestress procedures	40
4.3.4 Testing day: Stress induction	41
4.3.5 Testing day: Poststress procedures	42
4.4 Questionnaire measures	42
4.4.1 Social status: Job prestige, SES, and education	42
4.4.2 Aggression	43
4.4.3 Quality of life	44
4.4.4 Subjective stress	44
4.4.5 Proactivity: Masculinity/Instrumentality	44
4.4.6 Life events and social support	45
4.4.7 Depressive symptoms	45
4.4.8 Parental bonding and childhood adversity	45
4.5 Anthropometric and cardiovascular measures	46
4.5.1 BMI and waist circumference	46
4.5.2 Heart rate recordings and blood pressure assessments	47
4.6 Assessments of blood and saliva parameters	47
4.6.1 Blood and saliva sampling	47
4.6.2 Preanalytics	48
4.6.3 Biochemical analyses	48
4.6.4 Calculation of stress-related increases (Δ -values)	49
4.6.5 Correction for hemoconcentration	49
4.7 Statistics	50
5. Results	51
5.1 Set I: Manipulation check on stress induction and hemoconcentration	52

5.1.1 The TSST elicits cardiovascular and stress hormone responses	52
5.1.2 The TSST elicits hemoconcentration.....	53
5.2 Set II: Do T levels increase with social stress in men? If so, which mechanisms operate?.....	55
5.2.1 Testosterone levels increase in response to the TSST	55
5.2.2 Testosterone increases remain after correction for hemoconcentration	56
5.2.3 Testosterone increases are not associated with SAM stress alterations	57
5.2.4 Testosterone increases are not associated with cortisol levels.....	58
5.3 Set III: Is social status related to T stress increases and lower aggression?.....	59
5.3.1 Descriptives: Job prestige, aggression, quality of life, SES, education level	60
5.3.2 Higher job prestige is associated with higher T increases to stress.....	62
5.3.3 Higher job prestige is marginally associated with lower total and physical aggression.....	63
5.3.4 Job prestige is related to higher quality of life	63
5.3.5 SES and educational level are marginally associated with stress-related T increases	64
5.4 Set IV: Is social status associated with stress coping and health outcomes?	65
5.4.1 SAM responses: Higher job status is associated with higher epinephrine levels....	65
5.4.2 HPA responses: Job status is marginally associated with higher plasma cortisol responses.....	67
5.4.3 Job status is associated with lower subjective stress.....	68
5.4.4 Job status is associated with proactivity, less obesity and, marginally, with lower depression scores	68
5.4.5 Job status is marginally associated with less life stress	69
5.5 Set V: Is parental bonding associated with stress-related T increases, aggression, stress responses, and health outcomes?	70
5.5.1 Manipulation checks in the reduced sample.....	71
5.5.2 Paternal overprotection is associated with higher T responses to stress.....	72
5.5.3 Paternal overprotection is associated with childhood adversity, but adversity is low	74
5.5.4 Paternal overprotection is associated with masculinity, and, marginally, with lower anger	74
5.5.5 Paternal overprotection is unrelated to stress responses, but associated with lower blood pressure	76
5.5.6 Paternal overprotection is associated with better psychological health and lower depression scores	76

5.5.7 Paternal overprotection is associated with lower BMI and lower HbA1c levels	77
6. Discussion	79
6.1 Set I: Manipulation check on stress induction and hemoconcentration	80
6.2 Set II: Do T levels increase with social stress in men? If so, which mechanisms operate?.....	80
6.2.1 Psychosocial stress and acute alterations in T levels	80
6.2.2 Testosterone elevations and hemoconcentration.....	83
6.2.3 Testosterone elevations and SAM stress responses	83
6.2.4 Testosterone elevations and HPA stress responses.....	84
6.2.5 Limitations regarding set II and a note on general limitations of this study	84
6.2.6 Implications for theory.....	85
6.2.7 Implications for practice	86
6.3 Set III: Is social status related to T stress increases and lower aggression?.....	87
6.3.1 Social status and T alterations to psychosocial stress	87
6.3.2 Social status and lower aggression	88
6.3.3 Social status and higher quality of life	90
6.3.4 Associations with other forms of social status	90
6.3.5 Limitations regarding set III.....	91
6.3.6 Implications for theory.....	93
6.3.7 Implications for practice	93
6.4 Set IV: Is social status associated with stress coping and health outcomes?	94
6.4.1 Social status and catecholamine stress responses.....	94
6.4.2 Social status and HPA axis stress responses	95
6.4.3 Social status and subjective stress.....	96
6.4.4 Social status, proactivity, obesity, and mood.....	97
6.4.5 Social status and life stress	98
6.4.6 Limitations regarding set IV	98
6.4.7 Implications for theory.....	99
6.4.8 Implications for practice	99
6.5 Set V: Are stress-related changes in T levels related to parental bonding in childhood?	100
6.5.1 The TSST elicited stress responses and hemoconcentration in the reduced sample	100
6.5.2 Paternal overprotection and T stress responses	100
6.5.3 Paternal overprotection and its relation to childhood adversity	101

6.5.4 Paternal overprotection and aggression.....	102
6.5.5 Paternal overprotection and stress responses	102
6.5.6 Paternal overprotection, proactivity, depressed mood, BMI and glucose regulation.....	103
6.5.7 Limitations regarding set IV	104
6.5.8 Implications for theory.....	105
6.5.9 Implications for practice	106
6.6 Mechanisms of stress-related T increases differ between social status and paternal bonding	106
6.7 Social status and father bonding are both related to better health outcomes.....	108
6.8 Key findings in a nutshell.....	110
