1 Introduction	1
2 State of the art	3
2.1 Proteins	3
2.1.1 Amino acids	4
2.1.2 Peptide bond	5
2.1.3 Surface charge	5
2.1.4 Isoelectric point	6
2.1.5 Active site	6
2.1.6 UV/Vis activity	7
2.2 Buffersystems in protein crystallization	7
2.2.1 pH buffer	7
2.2.2 Precipitants	8
2.2.3 Anti-solvent	8
2.2.4 Polymers	9
2.3 Crystallization	9
2.3.1 Metastable zone	9
2.3.2 Kinetics	10
2.3.3 Protein crystals	11
2.3.4 Dissolution of crystals	12
3 Aim of the work	13
4 Materials and methods	15
4.1 Crystallization conditions for lysozyme	15
4.2 Width of the metastable zone	16
4.3 Kinetic measurements	18
4.3.1 Modified solubility measurement set-up	19
4.3.2 Vision probe	22

4.3.3	UV/Vis photometer	23
4.3.4	Calculation example of dissolution rate measurements .	23
4.4	X-ray measurement	24
4.5	Microscopy	26
4.5.1	Olympus BH2	26
4.5.2	Keyence VHX 500F	27
4.6	Enzymatic activity measurement	27
4.7	Water content measurements	28
4.7.1	TGA coupled MS	28
4.7.2	Karl-Fischer-Titration	29
4.8	Fundamental analysis	30
4.9	Particle size distribution	30
4.10	Coloration experiment	32
5	Results	33
5.1	Dissolution experiments	33
5.1.1	Dissolution in pure water	33
5.1.2	Influence of the pH value	35
5.1.3	Influence of the buffer components and concentration .	40
5.1.4	Influence of the precipitant substance	44
5.1.5	Influence of the precipitant concentration	45
5.1.6	Influence of the temperature	45
5.1.7	Phase transition test	45
5.1.8	Coloration experiment	46
5.1.9	Summary of dissolution experiments	47
5.2	Metastable zone	48
5.2.1	Influence of the pH value	48
5.2.2	Influence of the buffer components and buffer concen- trations	50
5.2.3	Influence by repeated dissolving and crystallizing cycles	52
5.3	Kinetic measurements	55
5.3.1	Validation of methods	55
5.3.2	Influence of the dissolution mechanism induced by pH .	55
5.3.3	Influence of temperature	57
5.3.4	Influence of the precipitant concentration	58

5.4	Enzymatic activity measurements	59
5.4.1	Influence of the pH value	59
5.4.2	Influence of the dissolution mechanism	59
5.4.3	Influence of the buffer composition and buffer concentration	60
5.4.4	Influence of repeated dissolving and crystallizing cycle	61
5.4.5	Shelf life test in climate chamber	62
5.5	Fundamental measurements concerning structure and composition	63
5.5.1	X-ray analysis	63
5.5.2	Water content	63
5.5.3	Fundamental analysis	65
5.5.4	Particle size analysis	65
6	Discussion	69
6.1	Fundamentals of protein crystals	69
6.1.1	Water content of protein crystals	69
6.1.2	Diffusional potential inside the water of protein crystals	69
6.1.3	“Counter ions” in protein crystals	70
6.1.4	Structural justification in protein crystals	71
6.1.5	Chemical composition of protein crystals	71
6.1.6	Particle size distribution after batch crystallization . .	72
6.2	Dissolution mechanism of lysozyme chloride	72
6.2.1	Influence of the pH value	73
6.2.2	Influence of the precipitant substance	73
6.2.3	Influence of other parameters	75
6.3	Metastable zone width of lysozyme chloride	75
6.3.1	Influence of the pH value	75
6.3.2	Influence of other parameters	77
6.4	Growth and dissolution rate	78
6.4.1	New methods for kinetic measurement	78
6.4.2	Growth and dissolution rates versus temperature . . .	79
6.4.3	Dissolution rate versus dissolution mechanism	80
6.4.4	Dissolution rate versus precipitant concentration	81
6.5	Enzymatic activity measurements	81
6.5.1	Measurement versus pH value	81

6.5.2	Measurement versus dissolution mechanism	81
6.5.3	Measurement versus buffer substance and concentration	81
6.6	Shelf life of protein crystals	82
6.6.1	Shift in the nucleation and solubility curve during crystallization	82
6.6.2	Enzymatic activity during crystallization	83
6.6.3	Enzymatic activity under changing storage conditions .	84
6.7	Conclusions	85
7	Outlook	89
8	Summary	91
9	Zusammenfassung	95
	List of symbols and abbreviations	V
	Bibliography	VII
	Statement of authorship	XIX
	Curriculum vitae	XXI
