Zusammenfassung	11
Abstract	13
1. Introduction	15
2. Theory	17
2.1. Carbon Nanotubes	17
2.1.1. Structure of graphene and single-walled carbon nanotubes	17
2.1.2. Electronic properties of graphene and single walled carbon nanotubes	21
2.1.3. Density of states in carbon nanotubes	30
2.1.4. Carbon nanotube networks - electrical transport and switching	31
2.2. Transparent conductive films and their figures of merit	33
2.3. Thin film transistors	34
2.3.1. Thin film transistor setup	34
2.3.2. Thin film transistor characteristics	35
2.3.3. Characterization of thin-film transistors	36
2.4. Liquid crystal displays	40
2.4.1. Nematic liquid crystals	41
2.4.2. Polymer dispersed liquid crystal displays	42
2.4.3. The twisted nematic liquid crystal display	43
2.4.4. The active matrix liquid crystal display	46
2.4.5. Demands on a thin-film transistor in an active matrix	48
2.5. Characterization methods	50
2.5.1. Layer adhesion	51
2.5.2. Sheet resistance and contact resistance	51
3. Simulation of percolation in carbon nanotube networks using the Monte-Carlo method	53
3.1. Setup of the Monte-Carlo simulation	53
3.1.1. Graphical analysis of simulation runs	55
3.1.2. Influence of pixel resolution	56

3.2. Results of CNN percolation simulations	58
3.2.1. Influence of channel geometry	58
3.2.2. Topography of forming networks	59
3.2.3. Influence of carbon nanotube length	64
3.2.4. Influence of metallic to semiconducting ratio	66
4. Carbon nanotube feedstock and preparation methods	67
4.1. Carbon nanotube synthesis	67
4.2. Purification and sorting methods	69
4.2.1. Purification	69
4.2.2. Sorting by electronic type	69
4.3. Utilised CNT feedstock	72
4.4. Preparation of CNT dispersions	72
5. Deposition and patterning of carbon nanotubes on glass and plastic substrates	75
5.1. Substrate preparation	75
5.1.1. Etch-stop and metal adhesion layer on plastic substrates	76
5.1.2. Self-assembled adhesion layer for CNNs on inorganic surfaces	76
5.2. Deposition method for use as transparent conductor	77
5.3. Deposition method for use as semiconductor in TFTs	78
5.4. Further deposition techniques from literature	80
5.5. Surfactant removal from deposited CNN	80
5.6. Patterning of CNN layers	80
5.6.1. CO ₂ snow-jet	81
5.6.2. Reactive ion etching	82
5.6.3. Stripping of photoresist	84
6. Carbon nanotube networks as transparent conductive films	85
6.1. CNTs vs. other transparent electronic conductors	85
6.2. Morphology and electro-optical performance of spray-coated CNNs	86
6.3. Contacting CNNs with metal layers	91
6.3.1. CNN-metal contact resistance	92
6.3.2. Metal layers compatible with flexible plastic substrates	93
6.4. Capping layer and liquid crystal orientation layer	94
6.5. Realization of display demonstrators	96
6.5.1. Polymer dispersed LCDs	97
6.5.2. Twisted nematic directly addressed displays	98
6.5.3. Active-matrix LCD	101
6.5.4. Polymer organic light emitting diode	107
7. Carbon nanotube network thin-film transistors	109
7.1. Mask set layout used for CNT-TFT realization	109
7.2. Process flow for CNT-TFT production	110

7.3.	Optimization of the spin-coating process	113
7.3.1.	Dispensing of SWNT suspension and solvent	113
7.3.2.	Static vs. moving dispense head	115
7.4.	CNT-TFT performance with a 1:2 mix of m-SWNTs and s-SWNTs	116
7.5.	CNT-TFT performance with 98% semiconducting SWNTs	118
8.	Conclusions and outlook	123
A.	Process parameter	125
A.1.	Cleaning of substrates	125
A.2.	Transparent conductive film process	125
A.3.	Polymer dispersed liquid crystal (PDLC) display fabrication	126
A.4.	Twisted nematic (TN) liquid crystal display fabrication	127
A.5.	a-Si:H AMLCD with CNN pixel electrodes	127
A.5.1.	AMLCD backplane	127
A.5.2.	AMLCD frontplane	129
A.5.3.	AMLCD assembly	130
A.6.	TFT process	131
B.	Roughness value definitions	133
C.	Further Monte-Carlo simulation results	135
D.	Further CNT-TFT results	137
