Content

1 Introduction and objectives ... 1
2 Theoretical background ... 5
2.1 Characteristics of labyrinthopeptins ... 5
2.2.1 Biosynthesis and structure ... 5
2.2.2 Production methods ... 8
2.2 Submerged cultivation of filamentous bacteria ... 9
2.3 Osmolality manipulation for tailored morphology ... 10
2.4 Image Analysis ... 11
2.5 Rheology ... 13
2.5.1 Basic definitions ... 13
2.5.2 Rheological measurement geometries ... 16
2.5.3 Viscoelasticity ... 17
2.5.4 Rheological aspects of filamentous cultures ... 19
2.6 Downstream processing ... 22
2.6.1 Hydrophobic interaction chromatography ... 22
2.6.2 Ion exchange chromatography ... 25
3 Material and methods ... 27
3.1 Cultivation protocols ... 27
3.1.1 Strain maintenance ... 27
3.1.2 Media and shaking flask cultivation ... 27
3.2 Analysis protocols ... 28
3.2.1 Cell dry weight determination ... 28
3.2.2 Glucose and glycerol determination ... 28
3.2.3 Starch determination ... 29
3.2.4 Oxygen determination ... 29
3.2.5 Labyrinthopeptin determination ... 29
3.2.6 Osmolality determination ... 29
3.3 Microscopy and image analysis ... 30
3.3.1 Analysis of macro-morphology ... 30
3.3.2 Analysis of micro-morphology ... 31
3.4 Rheological measurements ... 31
3.4.1 Rotational tests ... 31
3.4.2 Oscillatory tests ... 32
3.5 Downstream processing ... 33

3.5.1 Preparation of crude extracts 33
3.5.2 Anion exchange chromatography 33
3.5.3 Hydrophobic interaction chromatography 33
4 Results and discussion 35
4.1 Preliminary investigations 35
4.1.1 Cultivation medium optimization 35
4.1.2 Strain maintenance 38
4.1.3 Difference between cultivation in darkness and under light exposure 39
4.1.4 Effect of pH value 40
4.2 Growth characteristics in medium 5294 41
4.3 Increase in productivity by salt-enhanced cultivation 43
4.4 Morphology changes by salt-enhanced cultivation 49
4.4.1 General aspects of digital imaging 49
4.4.2 Categorization into morphological classes 50
4.4.3 Pellet analysis (macro-morphology) 52
4.4.4 Hyphal network analysis (micro-morphology) 55
4.4.5 Relation between macro- and micro-morphology 59
4.5 Rheological investigation of the cultivation broth 63
4.5.1 Rotational tests in different measuring geometries 63
4.5.2 Determination of rheological parameters and relation to micro-morphology 67
4.5.3 Viscoelastic properties 72
4.6 Downstream processing of labyrinthopeptins 77
4.6.1 Comparison of labyrinthopeptin extraction methods 77
4.6.2 Anion exchange chromatography (AEC) 80
4.6.3 Hydrophobic interaction chromatography (HIC) 82
4.6.4 Purification process combining AEC an HIC 84
5 Conclusion and outlook 87
