|          |   |           |
|----------|---|-----------|
| <b>1</b> | <b>Autonomous driving and simulational challenges</b>               | <b>1</b>  |
| 1.1      | Safety validation and simulative test drives . . . . .              | 1         |
| 1.2      | Principles of automotive radar sensors . . . . .                    | 3         |
| 1.2.1    | Static targets and their radar signal . . . . .                     | 4         |
| 1.2.2    | The Doppler effect and its influence . . . . .                      | 6         |
| 1.2.3    | Angle estimation with multiple receivers . . . . .                  | 9         |
| 1.2.4    | Radar signal processing and point clouds . . . . .                  | 10        |
| 1.3      | Modeling and standardized simulation frameworks . . . . .           | 14        |
| <b>2</b> | <b>State of research in automotive radar modeling</b>               | <b>17</b> |
| 2.1      | Differentiation of various modeling levels . . . . .                | 17        |
| 2.2      | Ray-tracing in environments of high-fidelity . . . . .              | 20        |
| 2.3      | Models executable in standardized environments . . . . .            | 21        |
| 2.3.1    | Simplified physical models . . . . .                                | 22        |
| 2.3.2    | Statistical sensor models . . . . .                                 | 24        |
| 2.4      | Validation and verification of sensor models . . . . .              | 25        |
| <b>3</b> | <b>Derivation of research questions, hypotheses and objectives</b>  | <b>29</b> |
| 3.1      | Inaccuracies of current ray cone tracing based models . . . . .     | 29        |
| 3.2      | Stochastic radar models based on deep generative networks . . . . . | 30        |
| 3.3      | Hybrid multipurpose approaches for radar sensor models . . . . .    | 31        |
| 3.4      | Deficiencies of current validation criteria . . . . .               | 32        |
| <b>4</b> | <b>Modeling challenges related to ray cone tracing</b>              | <b>33</b> |
| 4.1      | The caustic distance and the angular beam expansion . . . . .       | 33        |
| 4.2      | Estimating current errors in case of multiple reflections . . . . . | 37        |
| 4.3      | Consequences and lower bounds for the number of rays . . . . .      | 40        |
| <b>5</b> | <b>Approaches to statistical radar point cloud simulation</b>       | <b>43</b> |
| 5.1      | Statistical formulation of radar sensor modeling . . . . .          | 43        |
| 5.2      | Kernel density estimation and radar point clouds . . . . .          | 46        |
| 5.2.1    | Principles of kernel density estimation . . . . .                   | 46        |

---

|          |   |            |
|----------|---|------------|
| 5.2.2    | Multivariate application to radar point clouds . . . . .          | 49         |
| 5.3      | Deep generative networks as sensor models . . . . .               | 51         |
| 5.3.1    | Variational Autoencoder . . . . .                                 | 52         |
| 5.3.2    | Generative Adversarial Networks . . . . .                         | 54         |
| 5.4      | Comparison of learning capacities and its consequences . . . . .  | 56         |
| <b>6</b> | <b>A hybrid modeling approach for radar point clouds</b>          | <b>59</b>  |
| 6.1      | Tracing and catching rays as the baseline . . . . .               | 59         |
| 6.2      | Improvements to the ray casting approach . . . . .                | 64         |
| 6.2.1    | Characteristic scattering centers . . . . .                       | 64         |
| 6.2.2    | The Doppler effect of wheels and tires . . . . .                  | 66         |
| 6.3      | Capabilities for data-based optimization . . . . .                | 72         |
| 6.3.1    | Adapting the distance-dependent measurement likelihood . . . . .  | 73         |
| 6.3.2    | The spatial measurement deviation of scattering centers . . . . . | 74         |
| 6.4      | Bottom line on the hybrid modeling approach . . . . .             | 75         |
| <b>7</b> | <b>Validation based on statistical hypothesis testing</b>         | <b>77</b>  |
| 7.1      | Consistency of validation criterion . . . . .                     | 77         |
| 7.2      | On the Kolmogorov-Smirnov test . . . . .                          | 79         |
| 7.3      | Applications to radar sensor models . . . . .                     | 83         |
| 7.3.1    | Scenario based application . . . . .                              | 83         |
| 7.3.2    | Position based application . . . . .                              | 85         |
| 7.4      | Retrospective and future validation challenges . . . . .          | 87         |
| <b>8</b> | <b>Conclusion and prospective challenges</b>                      | <b>89</b>  |
| 8.1      | Recap of the radar point cloud simulation . . . . .               | 89         |
| 8.2      | Lessons learned and future recommendations . . . . .              | 91         |
|          | <b>Nomenclatur</b>  | <b>93</b>  |
|          | <b>References</b>   | <b>99</b>  |
