Contents

1	Introduction	1
1.1	Applications of capillary transport	2
1.1.1	Propellant Management Devices	2
1.1.2	Heat Pipes	4
1.2	Embedment of this work in the frame of PoreNet	5
1.3	Questions and aims of this work	6
I	Fundamental discussion of capillary flow	9
2	Theory of capillary dominated flows - State of the art	11
2.1	Literature review	11
2.1.1	Capillary rise	11
2.1.2	Porous media	13
2.2	Pore structure parameters and analogies	15
2.2.1	Porosity	15
2.2.2	The Darcy law and extensions	16
2.2.3	Static radius	17
2.3	Radial capillary transport	18
2.4	Linear flow in a tube: Governing equations	19
2.4.1	Meniscus details	19
2.4.2	Mass balance	21
2.4.3	Energy balance	22
2.4.4	Linear momentum balance in z direction	22
2.4.5	Gravity force and inclination	27
2.4.6	Simplified linear momentum balance and corresponding assumptions	29
2.5	Equation for porous media using the Darcy law	30

2.6	Radial flow in porous media: Governing equations	31
2.6.1	Mass balance	31
2.6.2	Linear momentum balance in radial direction	32
3	Dimensionless scaling methods for capillary rise	35
3.1	Introduction	35
3.2	Dimensionless scaling	36
3.2.1	Viscous effects and gravity as scaling forces (index †)	37
3.2.2	Inertia and gravity as scaling forces (index ‡)	39
3.2.3	Inertia and viscous effects as scaling forces (index *)	40
3.3	Discussion	42
3.4	Conclusion	43
3.5	Excursion - Applying the Buckingham π Theorem	44
4	The transition from inertial to viscous flow	49
4.1	Introduction	49
4.2	Analytical solutions for defined time domains	50
4.2.1	Purely inertial time domain	50
4.2.2	Visco-inertial time stage	50
4.2.3	Purely viscous time stage	50
4.2.4	Viscous and gravitational time stage	51
4.3	Separation of time stages	51
4.4	Discussion in dimensionless form	54
4.5	Conclusion	56
5	Analytical solutions including the gravity term	57
5.1	Introduction	57
5.2	Viscous dominated flow	58
5.3	Viscous and hydrostatic dominated flow regime	59
5.3.1	Practical evaluation of the Lambert W function	63
5.3.2	Time to reach the equilibrium height	63
5.3.3	Flow velocity	64
5.3.4	Dimensional analysis	65
5.4	Validity of the Lucas-Washburn equation	66
5.5	Experimental evidence	68

5.6	Evaluation for a general initial condition	70
5.6.1	Time to reach the equilibrium height	72
5.6.2	Comparison with experimental results from literature	73
5.7	Conclusion	74
6	A basic macroscopic numerical simulation with FLOW-3D	77
II	Special investigated cases	81
7	Linear capillary rise and the effect of evaporation	83
7.1	Introduction	83
7.2	Applicable equations (no evaporation)	83
7.3	Experiments	85
7.3.1	Porous materials and fluid properties	85
7.3.2	Experimental setup and data acquisition	88
7.3.3	DTW: capillary rise experiments - height approach	90
7.3.4	DTW: capillary rise experiments - mass approach	93
7.3.5	Filter frits: capillary rise experiments - mass approach	98
7.3.6	DTW: The effect of evaporation	101
7.4	Applicable equations (evaporation)	103
7.5	Analytical solution	106
7.5.1	Dimensional analysis	107
7.5.2	Time needed to reach $0.99 h_{eq}$	108
7.5.3	Evaluation of the model with experimental data (DTW)	109
7.6	Conclusion	113
8	Radial capillary transport	115
8.1	Applicable equations	115
8.2	Experimental Apparatus	119
8.3	Results	124
8.3.1	Reference measurement - linear transport	125
8.3.2	Radial outward wicking	126
8.3.3	Overview on obtained wicking constants	131
8.3.4	Dimensionless presentation	131
8.4	Discussion	132

8.5	Conclusion	135
9	Summary	137
9.1	Dimensionless scaling methods	137
9.2	Transition between different time regimes	138
9.3	Analytical solutions including the gravity term	138
9.4	Macroscopical numerical simulation	139
9.5	Capillary rise and the effect of evaporation	140
9.6	Radial capillary transport	140
9.7	Pore structure parameters	141
	Appendix	143
A	Mathematical derivations	143
A.1	Derivation of the Quéré solution	143
A.2	Derivation of the Bosanquet solution	144
A.3	Derivation of the implicit Washburn equation	145
A.4	Mathematical verification of the extended equation	146
A.5	Derivation for a general initial condition	147
	Bibliography	149
