1	Introduction	5
1.1	Motivation and objectives	5
1.2	Fundamentals of espresso extraction: state of the art	7
1.2.1	Characterization of bimodal distributions	7
1.2.2	Particle porosity of roasted coffee	8
1.3	Extraction kinetics	8
1.3.1	Lipids	9
1.4	Mechanistic model to describe the espresso extraction process	9
1.5	Microscopic scale: mass transfer from single particles	10
1.6	Macroscopic scale: packed bed of coffee particles	12
1.6.1	Compression of granular beds	12
1.7	Mechanics involved in the espresso packed bed	13
1.7.1	Coffee bed permeability	14
1.7.2	Axial dispersion	16
2	Materials and Methods	19
2.1	Coffee beans and grounds	19
2.1.1	Milling machines	19
2.2	Methods: coffee powder and packed bed properties characterization	21
2.2.1	Particle size distribution measurements	21
2.2.2	Helium pycnometer	22
2.2.3	Mercury porosimetry	22
2.2.4	Water activity	23
2.2.5	Scanning Electron Microscopy SEM	23
2.2.6	Particle surface roughness	23
2.2.7	Surface lipids determination	24
2.3	Packed bed compression experiments	24
2.3.1	Powder Rheometer	24

2.3.2	Texture analyzer	25
2.4	Packed bed permeability experiments	26
2.4.1	Coffee machine system	26
2.4.2	Water hardness evaluation	26
2.4.3	Experiment conditions	28
2.4.4	Determination of the initial dry bed porosity	28
2.4.5	Calculation of the steady state permeability	29
2.4.6	Determination of the water residence time distribution and axial diffusion coefficient	29
2.5	Components extraction kinetics experiments	31
2.5.1	Experiment set up, coffee brewing and sampling	32
2.5.2	Non-volatile key marker components	32
2.5.3	HPLC-DAD Analysis for quantitative analysis of marker components in coffee extract	33
2.5.4	Chemicals	33
2.5.5	Normalization of extracted marker compounds concentrations	33
2.5.6	Determination of total dissolved solids	34
2.5.7	Packed bed water saturation	34
2.6	Mechanistic extraction model	34
3	Coffee powder characterization	37
3.1	Particle size distribution determination	37
3.1.1	Characterization of the bimodal particle size distribution . .	37
3.2	Intrinsic density, open, closed and bed bulk porosity results	39
3.3	Coffee particles water activity	40
3.4	Coffee particles surface roughness	40
3.4.1	Study of structural modifications in coffee particles after wetting of the packed bed	42
3.5	Lipids content on the coffee particles surfaces	43
3.6	Summary	44
4	Packed bed compression	47
4.1	Correlation between particle size distribution and packed bed axial compression	47
4.1.1	Impact of portafilter wall friction	48
4.1.2	Packed bed compression semi-empirical model as a function of particle size distribution parameters	49
4.1.3	Model validation at the espresso portafilter compression system	53
4.2	Summary	55

5	Bed water percolation	57
5.0.1	Experiment particle size distributions	57
5.1	Results and discussion	60
5.1.1	Water hardness	60
5.1.2	Impact of dry bed porosity on steady-state permeability . . .	60
5.1.3	Modified Kozeny-Carman equation to predict bed permeability	62
5.2	Dispersed plug flow inside the espresso packed bed	63
5.2.1	Analysis of the residence time distribution curve	64
5.2.2	Comparison of the axial flow dispersion results	66
5.3	Practical applications	67
5.4	Summary	69
6	Extraction kinetics	71
6.0.1	Particle size distributions for the packed bed configurations parameter study	71
6.1	Results and discussion	71
6.1.1	Analysis of the extraction flow and pressure drop profile . . .	72
6.1.2	Impact of simultaneously increasing the bed size and perme- ability on extraction composition	72
6.1.3	Impact of increasing the bed size by decreasing permeability on extraction composition	78
6.1.4	Impact of particle size distribution width on extracted composition	82
6.1.5	Analysis of compounds extraction kinetics	82
6.2	Practical applications and evaluation of the extraction homogeneity in the bed	85
6.3	Summary	89
7	Modelling espresso extraction	93
7.1	Theoretical introduction	93
7.1.1	Model assumptions	93
7.2	Model description	94
7.2.1	Transport through the internal pores of the particles	94
7.2.2	Transport from the surface of the particles to the intergra- nular pores	95
7.2.3	Macroscopic extraction equations	96
7.2.4	Modeling extraction of individual species	96
7.2.5	Modeling espresso extraction as dispersed flow through the packed bed	97
7.3	Results and discussion	98

7.3.1	Fitting model parameters to experiment instant concentration at bed exit	98
7.3.2	Importance of axial diffusion in the proposed model	100
7.3.3	Prediction of individual components instant concentration at bed exit	103
7.3.4	Full solution of the extraction model system of equations . .	103
7.3.5	Model validation with experiments using different particle size distributions	105
7.3.6	Analysis of calculated mass transfer coefficients from individual components	107
7.4	Practical applications	111
7.5	Summary	115
8	Conclusions	117
8.1	Bed compression, the first important step that determines the packed bed porosity and the extraction hydrodynamic conditions	117
8.2	About the correlation between the dynamic process of water percolating through packed bed and extraction kinetics of key marker components	118
8.3	Particle size distribution, the opportunity to control the dynamic process of espresso extraction	120
A	Appendix	123
A.1	Coffee particles characterization	123
A.2	Water percolation	123
A.3	Extraction kinetics	125
