Abbreviations	v
Zusammenfassung	viii
Summary	x
1 Introduction	1
1.1 Self- and non-self-molecular patterns	1
1.2 Pattern-triggered immune signaling is initiated by PRR complexes	3
1.2.1 LRR-RLKs	3
1.2.2 LysM-RLKs	4
1.3 RLCKs are activated by PRR complexes through phosphorylation	5
1.4 Phosphatases act as phosphorylation erasers to modify immune signaling.	7
1.5 Early immune responses depend on phosphorylation of signaling players	9
1.5.1 Ion fluxes lead to membrane depolarization and extracellular alkalization	9
1.5.2 Reactive oxygen species (ROS) production	11
1.5.3 Mitogen-activated protein kinase (MAPK) activation	12
1.6 Signaling specificity	13
1.7 Aims of this work	14
2 Methods	17
3 Results	31
3.1 A phospho-proteomics perspective of phyto cytokine versus MAMP signaling	31
3.1.1 Experimental design	31
3.1.2 Description of the phospho-proteomics data	34
3.1.3 Identification and specificity of elicitor-responsive sites	36
3.1.4 Elicitor responses are characterized by different phospho-site temporal profiles	38
3.1.5 Elicitor-specificity is achieved at different levels of regulation	45
3.1.6 Respiratory burst oxidase homologs (RBOHs) are putative substrates of SIPL1a in DAMP/MAMP-triggered signaling pathways	48
3.1.7 ROS burst was specifically mediated upon systemin or flg22 under the expression of SIPL1a site-directed mutagenesis mutants	52
3.2 Poltergeist-Like 2 (PLL2)-dependent activation of herbivore defense distinguishes systemin from other immune signaling pathways	55
3.2.1 Systemin signaling events are SYR1-dependent	55
3.2.2 Systemin-specific dephosphorylation is lost in <i>syr1</i>	57
3.2.3 PP2C phosphatases predominate in the systemin-specific response	59
3.2.4 SIPL2 is activated by dephosphorylation	61
3.2.5 Systemin triggers the interaction between PLL2 and H ⁺ -ATPases (LHA1 and LHA4)	63

3.2.6	Systemin regulates the H ⁺ -ATPase activity in planta	67
3.2.7	SIPLL2 plays an important role in systemin signaling pathway.....	69
4	Discussion	73
4.1	Extracellular alkalization is a readout of early PTI events.....	73
4.2	Missing data is a common issue in label-free quantitative (phospho-)proteomics	73
4.3	MapMan enrichment analysis was performed in the phospho-protein level.....	76
4.4	The interpretation and limitation of the network analysis.....	77
4.5	Different phosphorylation regulatory mechanisms contribute to the specificity of systemin, flg22 and chitin signaling.....	79
4.5.1	Pattern-triggered common responses involve different SIPBL proteins of the same RLCK VII subfamily	79
4.5.2	All pattern-triggered responses involve the phosphorylation of SISLAC1 at Ser51: elicitor specificity is achieved by different phosphorylation kinetics.....	81
4.5.3	Pattern-triggered common responses involve the same phosphatase SIPLL1a: specificity is achieved at multiple sites with distinction in phosphorylation kinetics to different elicitors. 82	
4.6	The tomato PLL1a-RBOH module regulates the pattern-triggered ROS burst	83
4.7	Systemin signaling relies on the specific activation of PP2C phosphatases	86
