|-------------------------------------------------------------------------------|-----------|
| <b>1. Introduction</b>                                                        | <b>1</b>  |
| 1.1. Motivation . . . . .                                                     | 4         |
| 1.2. Aims and objectives . . . . .                                            | 5         |
| 1.3. Outline . . . . .                                                        | 6         |
| <b>2. Fundamentals and theory</b>                                             | <b>9</b>  |
| 2.1. Fluids under electric fields . . . . .                                   | 9         |
| 2.1.1. Fluid properties . . . . .                                             | 9         |
| 2.1.2. Force resulting from an electric field on a dielectric fluid . . . . . | 10        |
| 2.2. Continuity equation . . . . .                                            | 12        |
| 2.3. The equations of motion . . . . .                                        | 13        |
| 2.3.1. The material derivative . . . . .                                      | 13        |
| 2.3.2. Surface forces . . . . .                                               | 14        |
| 2.3.3. Body forces . . . . .                                                  | 15        |
| 2.3.4. Combined momentum equations . . . . .                                  | 16        |
| 2.4. Heat equation . . . . .                                                  | 16        |
| 2.5. Dimensionless equations . . . . .                                        | 17        |
| <b>3. Current state of research</b>                                           | <b>20</b> |
| 3.1. Buoyant flows . . . . .                                                  | 20        |
| 3.1.1. Natural convection . . . . .                                           | 20        |
| 3.1.2. Buoyant flow in TEHD convection . . . . .                              | 21        |
| 3.2. Fluids subjected to solid-body rotation . . . . .                        | 25        |
| 3.3. Fluids subjected to differential rotation . . . . .                      | 26        |
| 3.3.1. Cylindrical Taylor-Couette flow . . . . .                              | 27        |
| 3.3.2. Spherical Taylor-Couette . . . . .                                     | 28        |

|                                                                                           |           |
|-------------------------------------------------------------------------------------------|-----------|
| <b>4. Computational and numerical modelling</b>                                           | <b>32</b> |
| 4.1. Research approach and modelling configuration . . . . .                              | 32        |
| 4.2. Numerical methodology . . . . .                                                      | 34        |
| 4.2.1. The finite volume method . . . . .                                                 | 34        |
| 4.2.2. Time discretisation . . . . .                                                      | 35        |
| 4.2.3. Space discretisation . . . . .                                                     | 35        |
| 4.2.4. Methods of solution . . . . .                                                      | 35        |
| 4.3. Parameter space selection . . . . .                                                  | 36        |
| 4.3.1. Parameter selection for TEHD convection . . . . .                                  | 38        |
| 4.3.2. Parameter space for sTC . . . . .                                                  | 38        |
| 4.4. Diagnostics and evaluation . . . . .                                                 | 43        |
| 4.4.1. Thermal transport . . . . .                                                        | 43        |
| 4.4.2. Averaged kinetic energy . . . . .                                                  | 45        |
| 4.4.3. Spatial thermal mode energy (STME) . . . . .                                       | 45        |
| 4.4.4. Empirical orthogonal function . . . . .                                            | 46        |
| 4.5. Mesh independence . . . . .                                                          | 46        |
| <b>5. TEHD convection in spherical shell</b>                                              | <b>49</b> |
| 5.1. Model formulation . . . . .                                                          | 49        |
| 5.2. Results . . . . .                                                                    | 50        |
| 5.2.1. Spatial and temporal evolution of TEHD convection . . . . .                        | 51        |
| 5.2.2. Heat transfer and scaling . . . . .                                                | 58        |
| 5.3. Discussion . . . . .                                                                 | 60        |
| 5.3.1. Results in contrast to GeoFlow . . . . .                                           | 60        |
| 5.3.2. Consideration of the temperature-dependent Gauss in spherical geometries . . . . . | 64        |
| 5.3.3. Spherical TEHD convection compared to natural convection . . . . .                 | 66        |
| 5.4. Summary . . . . .                                                                    | 69        |
| <b>6. Non-isothermal spherical Taylor-Couette flow</b>                                    | <b>71</b> |
| 6.1. Model formulation . . . . .                                                          | 71        |
