Contents

Introduction **3**

1. State of the art and research objectives **7**
1.1. Melting of matter by ultrafast laser radiation 7
1.2. Research objectives and impacts of this thesis 12

2. Fundamentals of the ultrafast melting and ablation of matter **15**
2.1. Absorption of laser radiation 16
2.1.1. Absorption mechanisms 16
2.1.2. Free electron model 17
2.1.3. Absorption in dielectrics 20
2.1.4. Carrier redistribution 22
2.2. The two-temperature model 24
2.3. Structural changes and material removal 27
2.3.1. Near-threshold ablation 27
2.3.2. Plasma formation and expansion 29
2.3.3. Melting 31
2.3.4. Normal vaporization 33
2.3.5. Normal boiling 34
2.3.6. Phase explosion 34
2.3.7. Critical point phase separation 35
2.3.8. Thermal diffusion and resolidification 36
2.4. Summary and implications for this work 37

3. Experimental tools and techniques **39**
3.1. Studying ultrafast phenomena with light 39
3.2. Ultrafast laser radiation 41
3.2.1. Generation and amplification of ultrafast laser radiation 41
3.2.2. Characterization of the pulse contrast 43
3.2.3. Characterization of the geometrical profile 47
3.2.4. Temporal delaying 50
3.3. Time-resolved diagnostics 54
3.3.1. Shadowgraphy 54
3.3.2. Transient quantitative phase microscopy TQPm . . . 56
3.3.3. Design of the multi-camera system 60

3.3.4. Calibration and evaluation of TQPm 60
3.3.5. Pump-probe arrangement for shadowgraphy and TQPm 64
3.3.6. Design of the vacuum chamber 67
3.4. Ex situ measurement techniques 67

4. Ultrafast phase transitions in metals 71
4.1. Determination of ablation thresholds 71
4.2. Time-resolved shadowgraphy 76
4.2.1. Ablation dynamics at delays $\tau \leqslant 18$ ns 76
4.2.2. Ablation dynamics at delays $\tau \leqslant 1.8$ μs 83
4.3. Measurements of ejecta volume 85
4.4. Study of the ASE contribution 89
4.5. Melt dynamics in vacuum 93
4.6. Experiments on confined samples 96
4.7. Model for ablation at large intensities 98

5. Melting and micro-welding of borosilicate glass and silicon 103
5.1. Melting of glass 103
5.1.1. Laser-induced refractive index changes 104
5.1.2. *In situ* phase microscopy of melting 107
5.2. Micro-welding of borosilicate glass and silicon 108
5.2.1. Principle of micro-welding 108
5.2.2. Morphological changes 109
5.3. Model for melt flow dynamics 112

6. Summary and outlook 115

Appendices 121

A. Abbreviations 121

B. Material properties 123
B.1. Metals 123
B.2. Borosilicate glass and silicon 123

C. Calculation of the Herriott cell parameters 125

D. TQPm acquisition and evaluation tools 127
D.1. Image acquisition and processing software 127
D.2. Compensation of phase distortions by Zernike polynomials . . 129

E. Calculation of laser-induced thermoelastic stress 131

Bibliography 133
