

Contents

1	Introduction	5
2	Exhaust systems in practice and theory	13
2.1	Catalytic Converters	13
2.1.1	The two phase model	18
2.1.2	The Navier–Stokes–Model of a Three–Way–Catalytic Converter	19
2.1.3	The application entropy production	21
2.1.4	The combustion models with reduced kinetics	21
2.2	Particle Filters	24
2.2.1	Technical realization of particle filters	27
2.2.2	Mathematical Modelling	30
3	Solution methods	35
3.1	The concept of point–symmetries	35
3.2	The concept of optimal systems	36
3.3	Construction of isomorphisms	42
3.4	Calculation of similarity reductions	45
3.5	Computer algebra application	51
4	System of Diffusion-Reaction Equations	57
4.1	Introduction	57
4.2	Dimension Analysis	58
4.3	Symmetry Investigation	60
4.4	Similarity reductions	66
4.4.1	The first reduction with k_1	66
4.4.2	The second reduction with k_2	67
4.4.3	The third reduction with k_1	68

4.4.4	The third reduction with k_3	68
4.4.5	The first reduction with k_5	69
4.4.6	The second reduction with k_2	69
4.4.7	The third reduction with k_2	70
4.4.8	The third reduction with k_1 and k_2	70
4.5	Solution of the ordinary differential equations	71
4.6	Modified Diffusion-Reaction-Equation	74
4.7	Conclusion	75
5	The Model of a Particulate Trap	77
5.1	Introduction	77
5.2	Original Model of a Particulate Trap	77
5.3	Generalization of the K-Model	83
5.4	Modelling the pressure term	84
5.5	Group Analysis of Filtration Processes	86
5.6	Discussion of the special cases	87
5.6.1	Application of Darcy's law	87
5.6.2	Application of the law of Hazen–Dupuit–Darcy	100
5.6.3	Application of Stoke's flow	101
5.6.4	Application of the Brinkman–Hazen–Dupuit–Darcy law	101
5.6.5	Consideration of a general case	101
5.7	Discussion	102
5.8	Conclusion	110
	Conclusion	111
	Acknowledgement	115
	Bibliography	119
	Curriculum Vitae	139
	Zusammenfassung (German)	145
	Erklärung (German)	149
