Contents

1 Introduction and motivation **1**

1.1 Probing the universe 1

1.1.1 Short historical background and discovery of the interstellar medium 1

1.1.2 Interstellar molecules, chemical networks and star formation - Tracers and spectral resolution 3

1.1.3 Comparison of recent and future observational experiments and receiver developments at KOSMA - Need for array compatible heterodyne detectors at 1 THz 5

1.2 Photon detectors for radio astronomy - Arrays and fundamental sensitivity 10

1.2.1 Coherent and incoherent detection 10

1.2.2 Superconductive waveguide mixers on silicon membranes . 14

1.3 Integrated detectors for heterodyne arrays 19

1.3.1 Balanced SIS mixers 19

1.3.2 Terahertz niobium SIS mixers with a niobium-titanium-nitride superconducting tuning circuit and a normal-metal energy-relaxation layer 20

2 Mesoscopic detector elements **25**

2.1 Linear-response theory, fluctuation-dissipation theorem and detector sensitivities 25

2.1.1 Fundamental sensitivity limit in detector arrays 38

2.2 Theories of superconductivity 43

2.2.1 Ginzburg-Landau theory of superconductivity in clean and disordered systems: coherence length, magnetic penetration-depth and supercurrent 43

2.2.2 The microscopic theory of Bardeen-Cooper-Schrieffer . . . 51

2.2.3 Interactions between quasiparticles in superconductors and normal metals 60

2.3 Quasiclassical quantum field theory in superconductors 69

2.3.1 Green's functions of superconductivity 69

2.3.2 Dirty superconductors I - The quasiclassical limit 73

2.3.3 Dirty superconductors II - Superconducting correlations in superconductor/normal metal proximity systems and boundary conditions 77

2.3.4 Results for NbTiN/Au bilayer structures 85

3 Design of planar superconducting transmission-lines and circuits 89
3.1 Microwave response of superconductors 89
3.1.1 Complex conductivity - Mattis-Bardeen theory 89
3.1.2 Complex conductivity in proximity and disordered superconductors - Nam theory 95
3.1.3 Superconducting transmission-lines 97
3.2 Balanced-mixer components design 109
3.2.1 Two-junction tuning circuit 109
3.2.2 Current density and tuning-circuit bandwidth 112
3.2.3 Commercial electromagnetic design software packages and their applicability for superconducting circuit engineering . 113
3.2.4 Broadband tapered-slotline waveguide antennas 114
3.2.5 380-520 GHz coplanar waveguide 90° RF hybrid-coupler . 119
3.2.6 Superconductor-insulator-superconductor circuit and alternating impedance transformer 123
3.2.7 Three-stage coplanar waveguide RF blocking-filter 127
3.2.8 Electromagnetic-field simulation of the balanced-mixer circuit in two different waveguide environments 130
3.2.9 An IF circuit-board for the first experiments 133

4 Experimental setup and measurement procedure 135
4.1 Balanced-mixer dewar assembly 135
4.1.1 Waveguide-mixer block assembly and IF circuit-board . . . 139
4.2 Balanced-mixer device chip fabrication 143
4.3 Setup schematic and general measurement procedure 145
4.3.1 Modification of the calibration blackbody-temperatures due to dielectric dewar-windows, IR filters and the beamsplitter 148

5 Characterization of 400-500 GHz planar-circuit balanced SIS mixers in two waveguide geometries 153
5.1 Introduction and comparison to related work 154
5.2 Measurement procedure and data analysis 155
5.3 The non-ideal balanced-mixer device 160
5.3.1 Effect of low NR value on the Y factor 166
5.4 Mixer characterization measurements 166
5.4.1 Balanced-mixer device in a step-discontinuity waveguide mixer-block using a Gunn-driven local-oscillator source . . 167
5.4.2 Balanced-mixer device in a continuous-waveguide mixer-block using a synthesizer-driven local-oscillator source . . . 172
5.5 Conclusion 178

6 Balanced SIS mixer as an input-noise meter 181
6.1 Introduction 182
6.2 LO input noise-temperature measurements 184
6.3 Influence of increasing LO near-carrier noise power on $T_{rec}(\nu)$ . . 196
6.4 Conclusion 199

7 Improved Nb SIS devices for heterodyne mixers between 700 GHz and 1.3 THz **201**
7.1 Introduction . . . 201
7.2 Device design and conceptual background . . . 203
7.3 Device variations and measurement setup . . . 208
7.3.1 Fabrication . . . 208
7.3.2 Measurement setup . . . 210
7.4 Experimental results and analysis . . . 210
7.5 Possible adverse effects due to inserted normal metal layer . . . 219
7.6 Conclusion . . . 220
7.7 Additional material . . . 221

8 Conclusion and Outlook **225**

A Properties of noise and measurement methods **231**
A.1 Wiener-Khinchin theorem and noise-power spectral density . . . 231
A.1.1 Classical formalism . . . 231
A.1.2 Quantum formalism . . . 233
A.1.3 Theorems . . . 234
A.2 Measurement of noise-power spectral density . . . 235
A.2.1 Square law detector - Classical calculation . . . 235
A.2.2 Incoherent detector - Quantum calculation . . . 236

B Electromagnetic wave propagation in a dielectric medium **241**
B.1 Definitions and assumptions . . . 241
B.2 Poynting theorem in a homogeneous lossy medium . . . 242
B.3 Propagation-matrix formalism . . . 244
B.4 Matching of an electromagnetic field across an interface . . . 245
B.5 Multiple scattering at two dielectric interfaces . . . 247
B.6 Fresnel formulas - General case of arbitrary incident angle . . . 248

C Balanced-mixer characterization measurement results **251**
C.1 Continuation of section 5.4.1 . . . 251
C.1.1 Heterodyne measurements with same mixer bias-polarity . 251
C.1.2 Heterodyne measurements with opposite mixer bias-polarity 256
C.2 Continuation of section 5.4.2 . . . 261
C.2.1 Heterodyne measurements with opposite mixer bias-polarity 261
